

INFINIUM™ Land & Sea

LATEST PI TECHNOLOGY

“The *Infinium LS* was designed for use both on land & in the water and due to a pulse induction’s (PI) ability to ignore even the most adverse ground conditions and detect targets at maximum depths, the *Infinium* is ideal for electronic prospecting, relic hunting, beach hunting & treasure diving.

“The *Infinium* is waterproof down to 200’, hence the LS (Land & Sea) designation. It can be mounted in one of 3 positions on the shaft or belt-mounted with the included pouch. Hip mounting will reduce the weight of the detector by almost 2 pounds and allows for easier operation of the controls to aid in identifying and pinpointing targets. For diving, shaft mounting is recommended to avoid becoming entangled in the cables..

“The *Infinium LS* is the only PI-type detector that features an audio target-ID circuit. The two-tone audio response varies depending on the type of target detected. A low conductive target such as gold jewelry, nickels, pull tabs, bullets and smaller gold nuggets will produce a high tone followed by a low tone as the coil passes over it. A high conductive target such as pennies, clad & silver coins, brass artifacts and large gold nuggets will produce a low tone followed by a high tone. Due to the way PI-detectors react to iron, a low-high tone will be received when iron is detected..

“The new *Infinium LS* incorporates the latest PI-technology and its performance in the field under a wide range of adverse conditions demonstrates that pulse units have come of age for many forms of treasure hunting other than only hunting saltwater beaches...It takes a bit to become proficient with; however, it has the ability to handle virtually any type of ground condition with little affect on its overall performance.”
