

QUALITY DETECTOR FOR WATER HUNTERS

“I have been treasure hunting for more than 37 years and while I am always willing to hunt for all types of lost valuables, my favorite form of treasure hunting is water hunting. The thrill of seeing the glint of a gold ring or old silver coin in the bottom of my scoop has not waned since I first ventured into the water with a detector in the early 1970s. One of the first underwater detectors I used years ago was the original *Sea Hunter* from Garrett Metal Detectors. With that unit and subsequent *Sea Hunters* — both pulse induction and VLF/TR models — I recovered countless coins and pieces of jewelry from sites around the world. So, when I heard that Garrett was sending me one of their new *Sea Hunters* to test, I was anxious to see what changes had been made to an already proven design...

“The *Sea Hunter Mark II* follows in the footsteps of its predecessor and provides water hunters with a quality metal detector that has been designed to provide years of service with features not found on other pulse detectors. With the innovative discrimination circuit found on the *Mark II*, one is able to not only ignore black sand and salt water typical of pulse induction units but much of the trash commonly encountered in popular sites such as swimming beaches.

“The *Mark II* comes complete with everything you need to configure the detector for beach hunting, wading or diving without the need to purchase any additional components. The only aspect you may want to look at changing is the use of bolts rather than spring clips in assembling the detector. I replaced two of the four bolts with spring clips which makes it easier to adjust the length of the shaft or collapse the unit for travel.”
